

Mega-Polisher V2B

Our Mega-Polisher is the largest vegetable polishing system in the world.

Potatoes • Carrots • Parsnips • Swedes • Turnips • Beetroot • Celeriac • Produce that needs a longer dwell time and more

General information

The Wyma Mega-Polisher is the largest vegetable polishing system in the world. It consists of two Vege-Polisher™ machines linked together.

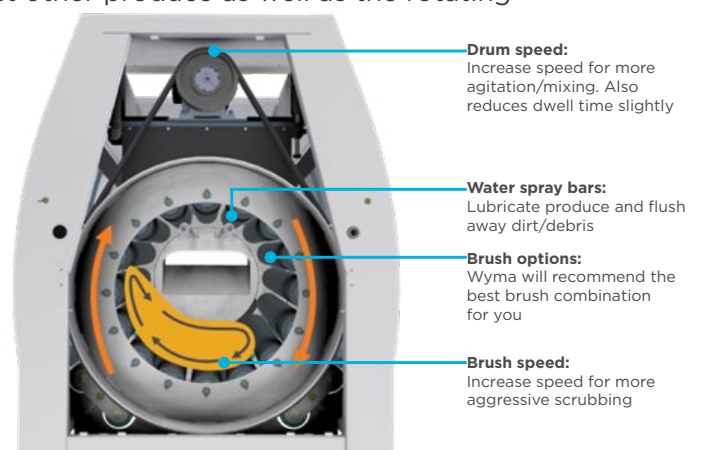

Rotary brush technology was invented by Wyma in the 1990s. We use our years of knowledge to make sure your machine suits your exact polishing needs. The Mega-Polisher has all the proven features of the Vege-Polisher™, but with much larger capacity.

The rotating drums are made up of rows of nylon brushes. Produce enters via a large infeed chute.

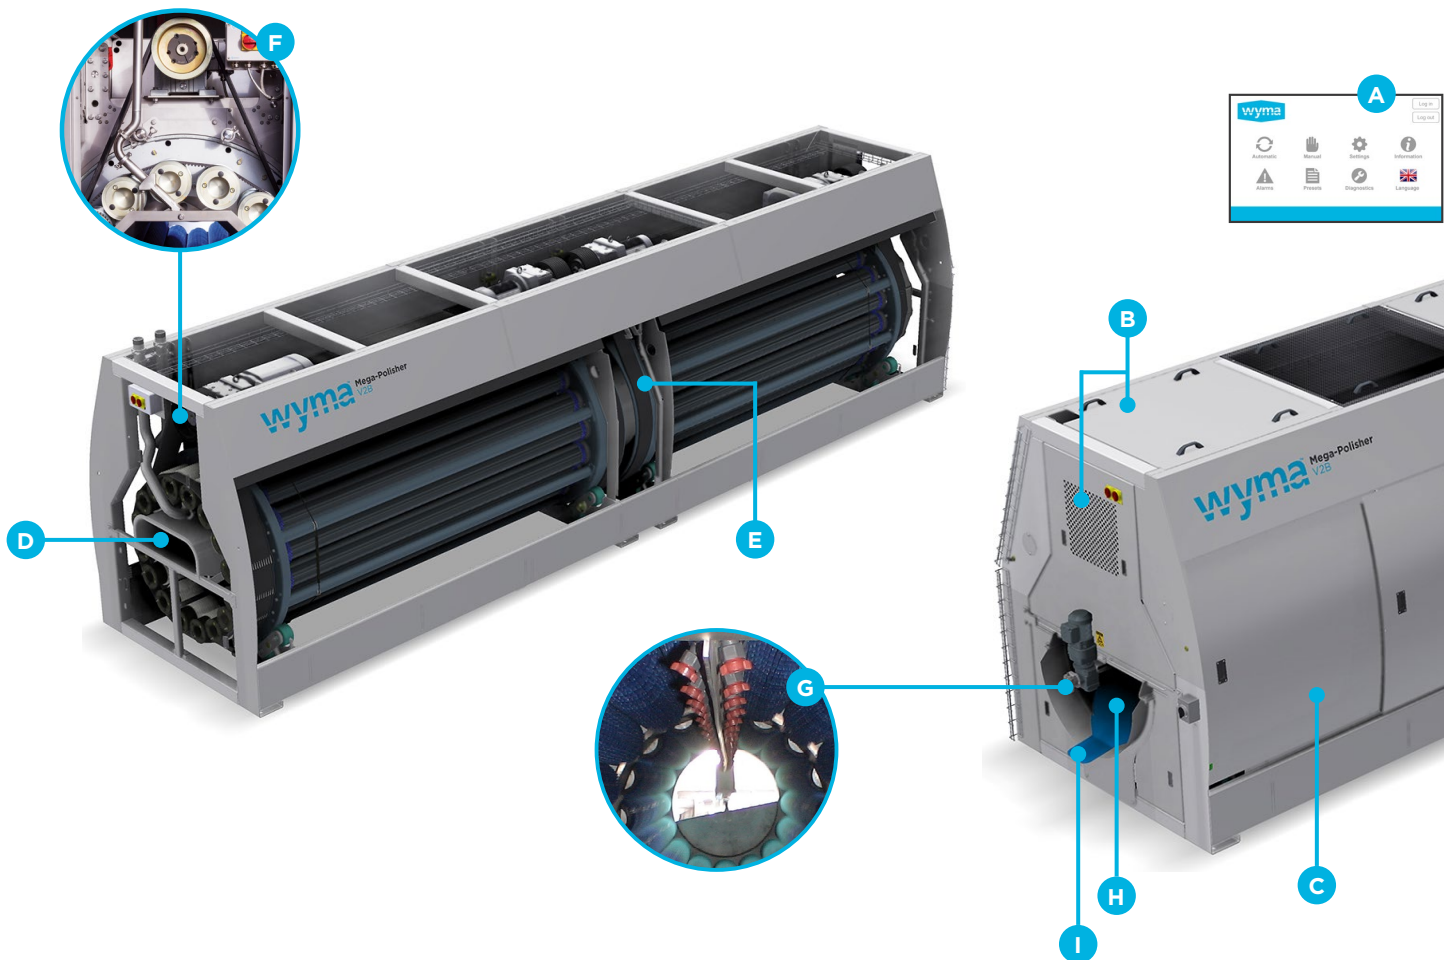

Two water pipes spray fresh and/or recycled water onto the produce as it travels through the drum. Produce is washed/polished as it rubs against other produce as well as the rotating brushes.

At the outfeed, produce slides down a chute with minimal drop for a smooth transition to downstream equipment.

The Mega-Polisher improves the appearance of fresh vegetables, resulting in more premium packed produce and increased presence on retailers' shelves. Wyma's experience with rotary brush drum technology and brush specification means vegetables are washed and polished to the highest retailing standards.

Features & benefits

A Operational controls

Stand alone or integrated in line panel. Touch screen, Variable speed control for brushes and drums.

B Removable top and end panels

Easy access for maintenance and cleaning.

C Sliding side doors

Easy access for maintenance and cleaning.

D Soft infeed chute*

Extra gentle produce entry.

E Soft transition between drums

Gentle produce handling.

F Reliable V and synchronous belt drive systems

Proven performance and durability.

G Spray bars

Lubricates produce and sprays recycled water on produce as it enters for best polishing results. Helps keep brushes clean and minimise debris build up.

H Adjustable outfeed gate

Controls how long produce stays in the drum, which controls the polishing intensity.

I Outfeed chute

Gentle exit for produce to the next stage in your line.

Customised brush configurations

To suit your produce and conditions, maximising polishing effectiveness.

Drum support rollers

Supports the drum, reducing sideways movement.

Reversible brush and drum motor

Extend brush life by reversing machine direction.
